

Table S4. Logistic regression to predict in-hospital mortality (n=596)

Variable	Adjusted odds ratio	95% Confidence interval	P-value
Opponent object			
Pedestrian	Reference		
Unknown	18.031	1.554–209.236	0.021

Variables included in multiple logistic regression: season, admission time, age ≥ 65 years, alcohol consumption, type of road, opponent object, and types of helmets.
